IE 345 - K "Introduction to Deep Learning: Fundamentals Concepts"

Prof. Yuzo

Common Python Syntax

pg. 31 - 35

```python
In [1]: print('Hello World')

        Hello World
```

```python
In [2]: a = 3
        b = 4
        c = a + b
        print('The value of a is {}, while the value of b is {}, and their sum c is {}'.format(a,
        b, c))

        The value of a is 3, while the value of b is 4, and their sum c is 7
```

```python
In [3]: a = 200
        b = 33

        if b > a:
            print('b is greater than b')
        elif a == b:
            print('a and b are equal')
        else:
            print('a is greater than b')

        a is greater than b
```

```python
In [4]: for x in range(2):
            print(x)

        0
        1
```

```python
In [5]: def my_function(planet):
            print('Hello '+ planet)

        my_function('Earth!')

        Hello Earth!
```
